Instructions. This exam consists of two parts. The first part will be graded with partial credit based on how well you explain your answer; the second part is similar to the computer graded homework with limited partial credit. On the second part, only the answers you write inside the boxes will be graded.

1. What is a differential equation?

   An equation containing the derivatives of one or more functions (or dependent variables), with respect to one or more independent variables, is said to be a differential equation.

2. What is a Bernoulli differential equation and what substitution helps solve it?

   The differential equation
   \[ \frac{dy}{dx} + P(x)y = f(x) y^n, \]
   where \( n \) is any real number, is called a Bernoulli equation. For \( n \neq 0 \) and \( n \neq 1 \), the substitution \( u = y^{1-n} \) reduces Bernoulli's equation to a linear equation.

3. What does it mean for the functions \( f_1(x), f_2(x), \ldots, f_n(x) \) to be linearly dependent?

   A set of functions \( f_1(x), \ldots, f_n(x) \) is said to be linearly dependent on an interval \( I \) if there exist constants \( c_1, \ldots, c_n \) not all zero such that
   \[ c_1 f_1(x) + \ldots + c_n f_n(x) = 0 \]
   for every \( x \) in the interval.

4. State the definition of the Laplace transform.

   Let \( f \) be a function defined for \( t \geq 0 \). Then the integral
   \[ \mathcal{L}\{f(t)\} = \int_0^\infty e^{-st} f(t) \, dt \]
   is said to be the Laplace transform of \( f \), provided that the integral converges.
5. Find the solution \( y(x) \) to the differential equation

\[
x \frac{dy}{dx} - 4y = x^6 e^x \quad \text{such that} \quad y(1) = 2.
\]

This is a linear ordinary differential equation. In standard form

\[
y' - \frac{4}{x}y = x^5 e^x
\]

integrating factor \( \mu = e^{\int \frac{-4}{x} \, dx} = e^{-4 \ln x} = x^{-4} \)

Thus

\[
(yx^{-4})' = xe^x
\]

so

\[
yx^{-4} = \int xe^x \, dx = \int x \, dx e^x = xe^x - \int e^x \, dx
\]

\[
= xe^x - e^x + C = (x-1)e^x + C
\]

consequently

\[
y = x^4(x-1)e^x + Cx^4
\]

when \( x = 1 \) we obtain

\[
y(1) = 1^4(1-1)e^1 + C = 2 - C = 2
\]

The unique solution is

\[
y(x) = x^4(x-1)e^x + 2x^4.
\]
6. Solve the differential equation

\[ \frac{dy}{dx} = e^{5x+6y} \quad \text{such that} \quad y(0) = 0 \]

by separation of variables.

\[ y(x) = -\frac{1}{6} \ln \left( \frac{11}{5} - \frac{5}{2} e^{5x} \right) \]

7. Determine whether the differential equation

\[ (2xy^2 - 6) \, dx + (2x^2y + 3) \, dy = 0. \]

is exact. If it is exact, solve it; if it is not exact, write *not* in the box.

\[ x^2y^2 - 6x + 3y = C \]

8. A tank contains 90 liters of fluid in which 20 grams of salt is dissolved. Brine containing 1 gram of salt per liter is then pumped into the tank at a rate of 3 L/min; the well-mixed solution is pumped out at the same rate. Find the number \( A(t) \) of grams of salt in the tank at time \( t \).

\[ A(t) = 90 - 70 e^{-\frac{x}{70} \cdot t} \quad \text{grams.} \]

9. Determine whether the set of functions

\[ f_1(x) = x, \quad f_2(x) = x^2 \quad \text{and} \quad f_3(x) = 4x - 7x^2 \]

is linearly independent on the interval \((-\infty, \infty)\).

(A) linearly dependent

(B) linearly independent
10. Find the general solution of the higher-order differential equation

\[ y''' - 9y'' + 15y' + 25y = 0. \]

The general solution is

\[ y(x) = c_1 e^{-x} + c_2 e^{5x} + c_3 x e^{5x}. \]

11. Find the general solution to the differential equation

\[ y'' + 4y = 2 \sin 2x \]

using undetermined coefficients. The general solution is

\[ y(x) = c_1 \cos 2x + c_2 \sin 2x - \frac{1}{2} x \cos 2x. \]

12. Solve the differential equation

\[ x^2 y'' + 7xy' + 9y = 0 \quad \text{for} \quad x > 0. \]

The general solution for \( x > 0 \) is

\[ y(x) = c_1 x^{-3} + c_2 (\ln x) x^{-3}. \]

13. Use the table of Laplace transforms attached to find \( \mathcal{L}\{f(t)\}(s) \) where

\[ f(t) = 4t^2 - 5 \sin 2t. \]

\[ \mathcal{L}\{f(t)\}(s) = \frac{8}{s^3} - \frac{10}{s^2 + 4}. \]
14. Use the table of Laplace transforms attached to find the inverse Laplace transform

\[ \mathcal{L}^{-1}\left\{ \frac{(s + 1)^3}{s^5} \right\}(t). \]

Write your answer as a function of \( t \).

\[ t + \frac{3}{2} t^2 + \frac{1}{2} t^3 + \frac{1}{24} t^4. \]

15. Use the Laplace transform to solve the initial-value problem

\[ y' + 4y = e^{6t} \quad \text{such that} \quad y(0) = 2. \]

The answer is

\[ y(t) = \frac{1}{10} e^{6t} + \frac{19}{10} e^{-4t}. \]

16. Find the Laplace transform

\[ F(s) = \mathcal{L}\{t(e^t + e^{3t})^2\}(s). \]

The Laplace transform is

\[ F(s) = \frac{1}{(s-2)^2} + \frac{2}{(s-4)^2} + \frac{1}{(s-6)^2}. \]

17. Find the inverse Laplace transform

\[ f(t) = \mathcal{L}^{-1}\left\{ \frac{e^{-s}}{s(s + 1)} \right\}(t). \]

The inverse Laplace transform is

\[ f(t) = (1 - e^{-(t+1)}) \text{U}(t-1). \]
18. Write the function

\[ f(t) = \begin{cases} 
0 & \text{for } 0 \leq t < 1 \\
t^2 & \text{for } t \geq 1.
\end{cases} \]

in terms of unit step functions. Find the Laplace transform \( F(s) = \mathcal{L}\{f(t)\}(s) \).

\[ F(s) = e^{-5} \left( \frac{2}{s^3} + \frac{2}{s^2} + \frac{1}{5} \right) \]

19. Use the convolution theorem to evaluate the Laplace transform

\[ F(s) = \mathcal{L}\left\{ \int_0^t \tau e^{t-\tau} d\tau \right\}(s). \]

The Laplace transform is

\[ F(s) = \frac{1}{s^2(s-1)}. \]

20. Use the Laplace transform to solve the initial-value problem

\[ y' - 4y = \delta(t - 5) \quad \text{such that} \quad y(0) = 0. \]

The solution is

\[ y(t) = e^{4(t-5)} u(t-5). \]
\[ \frac{dy}{dx} = e^{5x} + 6y, \quad y(0) = 0 \]

\[ \int e^{-6y} \, dy = \int e^{5x} \, dx \]

\[ \frac{1}{6} e^{-6y} = \frac{1}{5} e^{5x} + C \]

\[ e^{-6y} = \frac{6}{5} e^{5x} + C \]

\[ -6y = \ln \left( C - \frac{6}{5} e^{5x} \right) \]

\[ y = \frac{-1}{6} \ln \left( C - \frac{6}{5} e^{5x} \right) \]

\[ y(0) = \frac{-1}{6} \ln (C - \frac{6}{5}) = 0 \]

\[ C - \frac{6}{5} = 1 \quad \Rightarrow \quad C = \frac{11}{5} \]

Unique solution

\[ y(x) = \frac{-1}{6} \ln \left( \frac{11}{5} - \frac{6}{5} e^{5x} \right) \]
\#7 \quad (2xy^2 - 6)dx + (2x^2y + 3)dy = 0

\[ M = 2xy^2 - 6 \quad N = 2x^2y + 3 \]

\[
\frac{\partial M}{\partial y} = 4xy \\
\frac{\partial N}{\partial x} = 4xy
\]

Thus the equation is exact. Solve it as follows:

\[ \psi = \int (2xy^2 - 6)dx = x^2y^2 - 6x + f(y) \]

\[
\frac{\partial \psi}{\partial y} = 2x^2y + f'(y) = 2x^2y + 3
\]

\[ f(y) = \int f'(y)dy = \int 3dy = 3y + C \]

\[ \psi = x^2y^2 - 6x + 3y + C \]

Solution is

\[ x^2y^2 - 6x + 3y = C. \]
\[ \frac{dA}{dt} = 3.1 - 3 \frac{A}{90}, \quad A(0) = 20 \]
\[ \frac{dA}{dt} + \frac{1}{30} A = 3 \]
\[ m = e^{\frac{1}{30} t} \]
\[ \frac{d}{dt} \left( A e^{\frac{1}{30} t} \right) = 3 e^{\frac{1}{30} t} \]
\[ A e^{\frac{1}{30} t} = \int 3 e^{\frac{1}{30} t} \, dt = 90 e^{\frac{1}{30} t} + C \]
\[ A = 90 + C e^{-\frac{1}{30} t} \]
\[ A(0) = 90 - C = 20 \quad C = 70 \]
\[ A(t) = 90 - 70 e^{-\frac{1}{30} t} \]

#9
\[ f_1(x) = x, \quad f_2(x) = x^2, \quad f_3(x) = 4x - 7x^2 \]
\[ 4 f_1(x) - 7 f_2(x) - f_3(x) = 0 \]
\[ c_1 f_1(x) + c_2 f_2(x) + c_3 f_3(x) = 0 \]
where \( c_1 = 4, \ c_2 = -7, \ c_3 = -1. \)
Therefore dependent.
\( y'''' - 9y'' + 15y' + 25y = 0 \)

\[ y = e^{rx} \text{, characteristic equation is} \]
\[ r^4 - 9r^2 + 15r + 25 = 0 \]

If \( r = -1 \) then
\[
\frac{(1)^4 - 9(1)^2 + 15(-1) + 25}{r+1) \frac{r^2-10r+25}{r^3-r^2} \frac{-10r^2+15r+25}{-10r^2-10r} \frac{25r+25}{25r+25} = 0
\]

\[ r^2 - 10r + 25 = (r-5)(r-5) \]

Therefore the roots are \( r = -1 \) and \( r = 5 \) and the \( r = 5 \) root has multiplicity 2. Therefore
\[ y_1 = e^{-x}, \quad y_2 = e^{5x}, \quad y_3 = xe^{5x} \]

General solution
\[ y(x) = C_1 e^{-x} + C_2 e^{5x} + C_3 xe^{5x}. \]
#11 \ y'' + 4y = 2 \sin 2x

Homogeneous equation: \ y'' + 4y = 0
\ r^2 + 4 = 0, \ r = \pm 2i
\ y_1 = \cos 2x, \ y_2 = \sin 2x

Particular solution: Guess the solution
\ y = Ax \cos 2x + Bx \sin 2x
\ y' = Acos2x - 2Ax \sin 2x + B \sin 2x + 2Bx \cos 2x
\ = (A + 2Bx) \cos 2x + (B - 2Ax) \sin 2x
\ y'' = 2B \cos 2x - (2A + 4Bx) \sin 2x
\quad - 2A \sin 2x + (2B - 4Ax) \cos 2x
\ = 4(B - Ax) \cos 2x - 4(A + Bx) \sin 2x
\ 4y = 4Ax \cos 2x + 4Bx \sin 2x

\ y'' + 4y = 4B \cos 2x - 4A \sin 2x = 2 \sin 2x

B = 0 \ and \ A = -\frac{1}{2}

General solution
\ y(x) = C \cos 2x + L \sin 2x - \frac{1}{2} x \cos 2x
#12 \( x^2 y'' + 7xy' + 6y = 0 \) for \( x > 0 \)

\[
\begin{align*}
y &= x^n \\
y' &= nx^{n-1} \\
y'' &= n(n-1)x^{n-2}
\end{align*}
\]

\[
m(n-1) + 7n + 6 = 0
\]

\[
m^2 + 6m + 6 = 0
\]

\[
(m+3)(m+2) = 0
\]

Root \( m = -3 \) with multiplicity 2.

\[
y_1 = x^{-3} \quad y_2 = (\ln x)x^{-3}
\]

General solution

\[
y = c_1 x^{-3} + c_2 (\ln x)x^{-3}
\]
\# 13  \quad x(t) = 4t^2 - 5 \sin 2t

\begin{align*}
\mathcal{L}\{x(t)\} &= 4s^2 \mathcal{L}\{t^2\} - 5s \mathcal{L}\{\sin 2t\} \\
&= 4s^2 \frac{2}{s^3} - 5 \frac{2}{s^2 + 4} \\
&= \frac{8}{s^3} - \frac{10}{s^2 + 4}
\end{align*}

\# 14  \quad \mathcal{L}^{-1} \left\{ \frac{(s+1)^3}{s^5} \right\} = \mathcal{L}^{-1} \left\{ \frac{s^2 + 3s^2 + 3s + 1}{s^5} \right\} = \mathcal{L}^{-1} \left\{ \frac{1}{s^3} + \frac{3}{s^2} + \frac{3}{s} + 1 \right\} = t + 3 \frac{1}{2} t^2 + 3 \frac{1}{6} t^3 + \frac{1}{24} t^4

\begin{align*}
&= t + \frac{3}{2} t^2 + \frac{1}{2} t^3 + \frac{1}{24} t^4
\end{align*}
#15 \quad y' + 4y = e^{6t} \quad , \quad y(0) = 2

\[\begin{align*}
\frac{\partial y}{\partial t} &= \frac{\partial}{\partial t} \left( -y(0) + 5 \frac{\partial y}{\partial t} \right) = -y(0) + 5 Y = -2 + 5 Y \\
\frac{\partial^2 y}{\partial t^2} &= 4Y \\
\frac{\partial^3 e^{6t}}{\partial t^2} &= \frac{1}{5-6}
\end{align*}\]

Therefore

\[-2 + 5Y + 4Y = \frac{1}{5-6}\]

\[(5+4)Y = \frac{1}{5-6} + 2 = \frac{25-11}{5-6}\]

\[Y = \frac{25-11}{(5-6)(5+4)} = \frac{A}{5-6} + \frac{B}{5+4}\]

\[25-11 = A(5+4) + B(5-6)\]

\[A + B = 2\]

\[4A - 6B = -11\]

\[-4A - 4B = -8\]

\[10B = -19\]

\[B = \frac{-19}{10}\]

\[\begin{align*}
10A &= 1 \\
A &= \frac{1}{10}
\end{align*}\]

\[y(t) = \frac{A}{5-6} \int \frac{B}{5+4} f(t) = Ae^{6t} + Be^{-4t}\]

\[y(t) = \frac{1}{10} e^{6t} + \frac{19}{10} e^{-4t}\]
\[ \mathcal{L} \{ e^t + e^{3t} \} \mathcal{L}^{-1}(s) \]

\[ = \mathcal{L} \{ e^t + e^{4t} + e^{6t} \} \mathcal{L}^{-1}(s) \]

\[ = \left( \frac{1}{s^2} + \frac{1}{(s-2)^2} + \frac{1}{(s-4)^2} + \frac{1}{(s-6)^2} \right) \mathcal{L}^{-1}(s) \]

\[ = \mathcal{L} \{ \delta(t) + \delta(t-2) + \delta(t-4) + \delta(t-6) \} \]

\[ = \frac{1}{(s-2)^2} + \frac{2}{(s-4)^2} + \frac{1}{(s-6)^2} \]

\[ \# 17 \quad \text{Let} \quad g(t) = \mathcal{L}^{-1} \left\{ \frac{e^{-s}}{s(s+1)} \mathcal{L}^{-1}(s) \right\} = f(t) \]

\[ \text{Then} \quad g(t) = \mathcal{L}^{-1} \left\{ \frac{1}{s(s+1)} \mathcal{L}^{-1}(s) \right\} \]

\[ \mathcal{L} \{ g(t-1) \mathcal{L}^{-1}(s) \} = e^{-s} \mathcal{L}^{-1} \left\{ \frac{1}{s(s+1)} \mathcal{L}^{-1}(s) \right\} \]

\[ \frac{1}{s(s+1)} = A + B \]

\[ A + B = 0 \]

\[ A = 1, \quad B = -1 \]

\[ \text{Thus,} \quad g(t) = \left( \frac{1}{s+1} - \frac{1}{s} \right) \mathcal{L}^{-1}(s) \]

\[ \mathcal{L}^{-1}(s) = 1 - e^{-t} \]

\[ f(t) = g(t-1) \mathcal{U}(t-1) = (1 - e^{-t+1}) \mathcal{U}(t-1) \]
#18

\[ f(t) = \begin{cases} 
0 & \text{for } 0 \leq t < 1 \\
\frac{1}{2} & \text{for } t \geq 1 
\end{cases} \]

\[ f(t) = t^2 u(t-1) = (t-1)^2 u(t-1) \]

\[ \mathcal{L}\{f(t)\}_{s} = \mathcal{L}\{(t-1)^2 u(t-1)\}_{s} \]

\[ = e^{-s} \frac{d^2}{ds^2} \mathcal{L}\{1\}_{s} \]

\[ = e^{-s} \frac{d^2}{ds^2} (t+1)^2 \]

\[ = e^{-s} \left( \frac{2}{s^3} + \frac{2}{s^2} + \frac{1}{s} \right) \]

#19

\[ \mathcal{L}\{ \int_{0}^{t} e^{-\lambda \phi} d\phi \}_{s} \]

\[ = \mathcal{L}\{ \frac{1}{\lambda} (s^{-1} - s^{-\lambda}) \}_{s} \]

\[ = \frac{1}{s^2(s-1)} \]
**#20.** \( y' - 4y = \delta(t-5), \quad y(0) = 0 \)

\[-y(0) + 5y - 4Y = \mathcal{L}\{\delta(t-5)\}(s) = e^{-5s} \]

\[(s-4)Y = e^{-5s} \]

\[Y = \frac{e^{-5s}}{s-4} \]

\[y(t) = \mathcal{L}^{-1}\left\{\frac{e^{-5s}}{s-4}\right\} = f(t-5)u(t-5) \]

Where \( \mathcal{L}\{f(t)\}(s) = \frac{1}{s-4} \)

\[f(t) = y^{-1}\left\{\frac{1}{s-4}\right\} = e^{4t} \]

\[f(t-5) = e^{4(t-5)} \]

\[y(t) = e^{4(t-5)}u(t-5) \]
